1 in 4

adults will have a stroke in their lifetime.

In the U.S., someone has a stroke every 40 seconds. That is more than 795,000 people a year.

Meet Tanya

(a recent stroke survivor)

Let's follow Tanya's journey

The Lost Words

Tanya knows the word but can't say it. Therapy is an hour a week, and at home it's worksheets, with no one to tell her if she got it right.

About 1 in 3 stroke survivors has aphasia.

The Blank Faces

She blanks on her sister's name and on her blood thinner. Flashcards and brain games drill strangers' faces, not the people she needs to remember.

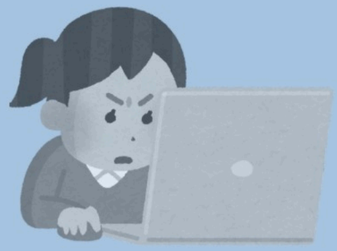

Up to 60% have memory or thinking problems in the first year.

The Uneven Steps

Her right leg drags and she trips at home. Her physio sees a few minutes of walking in clinic, and a fall button only works if she can press it.

Nearly half of survivors fall in their first year home.

The Scattered Team

Three specialists, three portals. She retells her story at every visit, and no one sees how she is doing between appointments.

Nearly 1 in 4 strokes happens to someone who has had one before.

Sources: Flowers et al., Arch Phys Med Rehabil 2016 (aphasia) · AHA/ASA Scientific Statement 2023 (cognition) · Walsh et al., FREESE cohort 2018 (falls) · CDC Stroke Facts 2024 (recurrence)

1.SPEECH:

A pocket speech coach. Tanya sees a picture and says the word. Steady listens, scores it, and climbs a gentle hint ladder when she is stuck. Missed words come back until they stick.

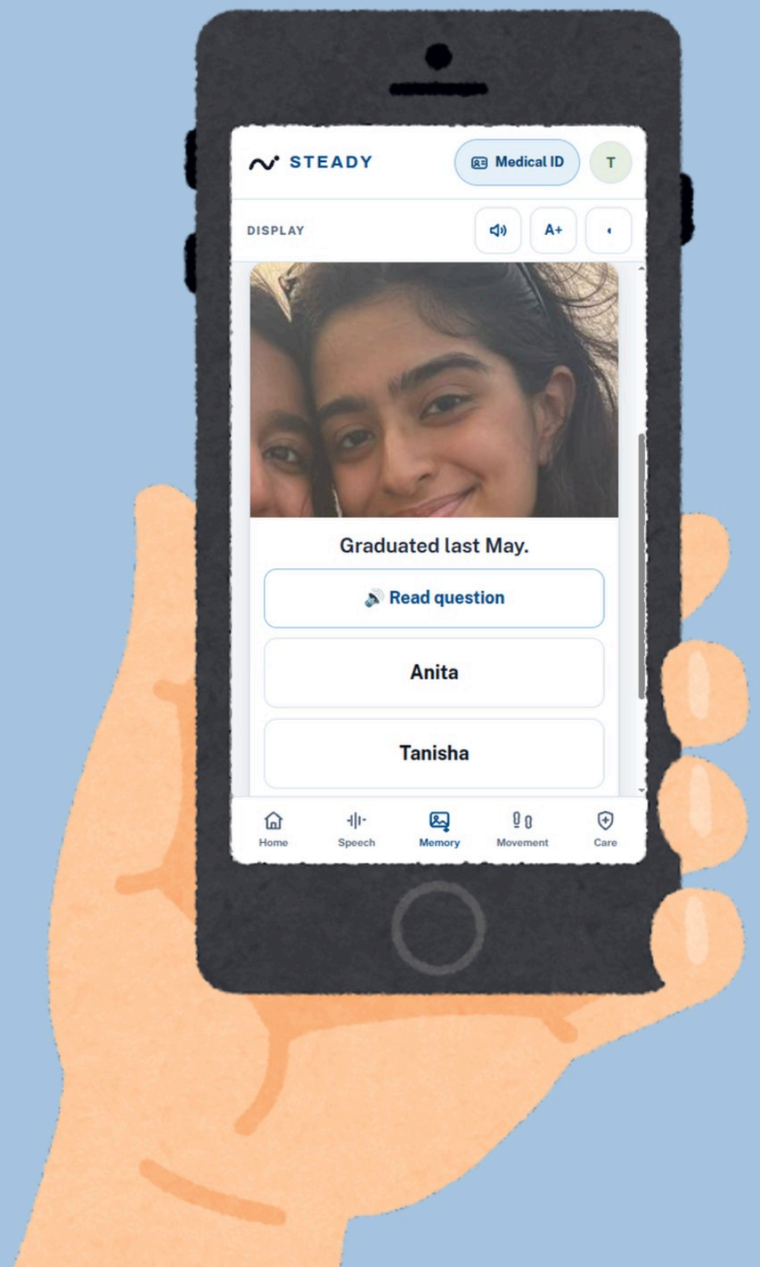

Speech recognition | Calm AI voice coach | Hint ladder

2.MEMORY:

Memory games built from her own life: name the faces in her family photos, then recall everyday words in order. A name she struggles with becomes tomorrow's speech practice.

Her own photos | Word-order recall | Feeds Speech

3.MOVEMENT:

A low-cost ankle sensor streams every stride over Bluetooth. Steady counts steps, cadence, leg swing and stride variation, so her physio sees real walks at home, not a hallway test.

ESP32-S3 + MPU-6050

Live over Bluetooth

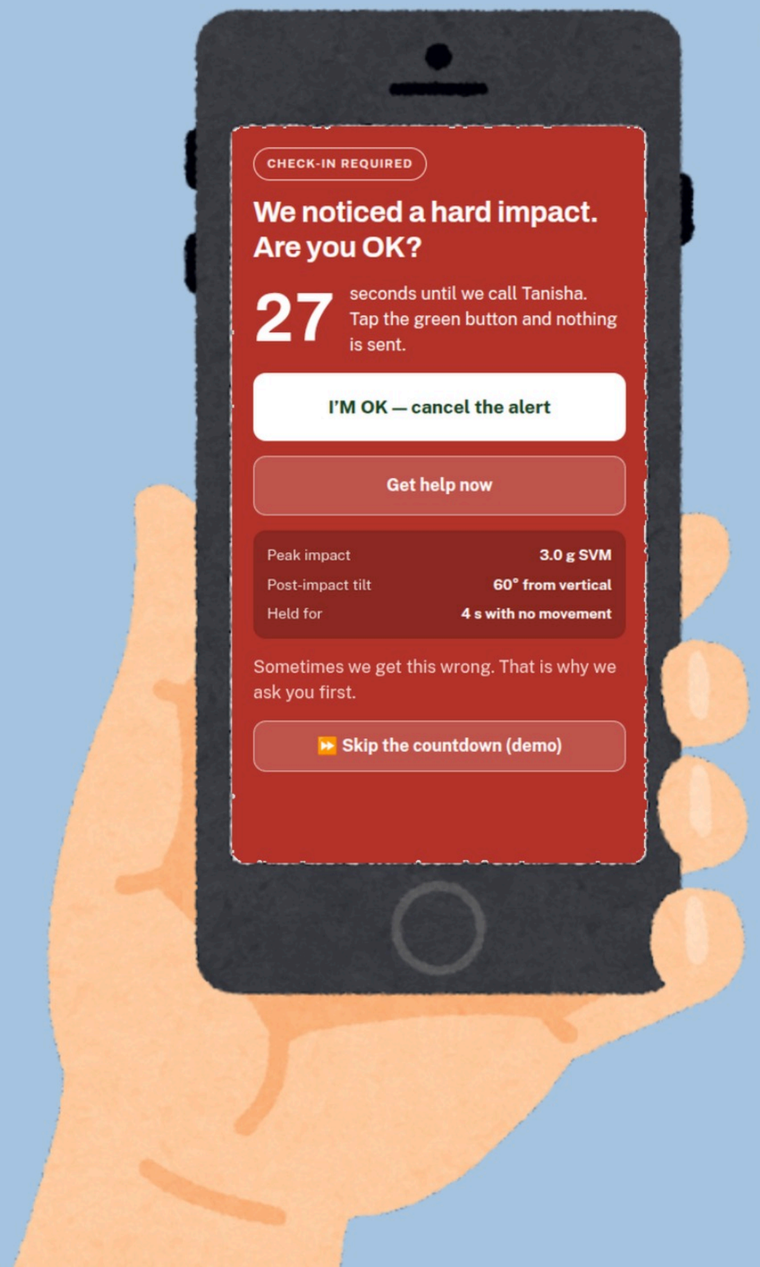

Gait symmetry

3.MOVEMENT:

If she falls, Steady asks first. Tanya has 30 seconds to tap “I’m OK”. If she can’t, her sister is called with her Medical ID. The same sensor tracks arm raises for shoulder recovery.

Fall detection | Asks before it calls | Arm-raise mode

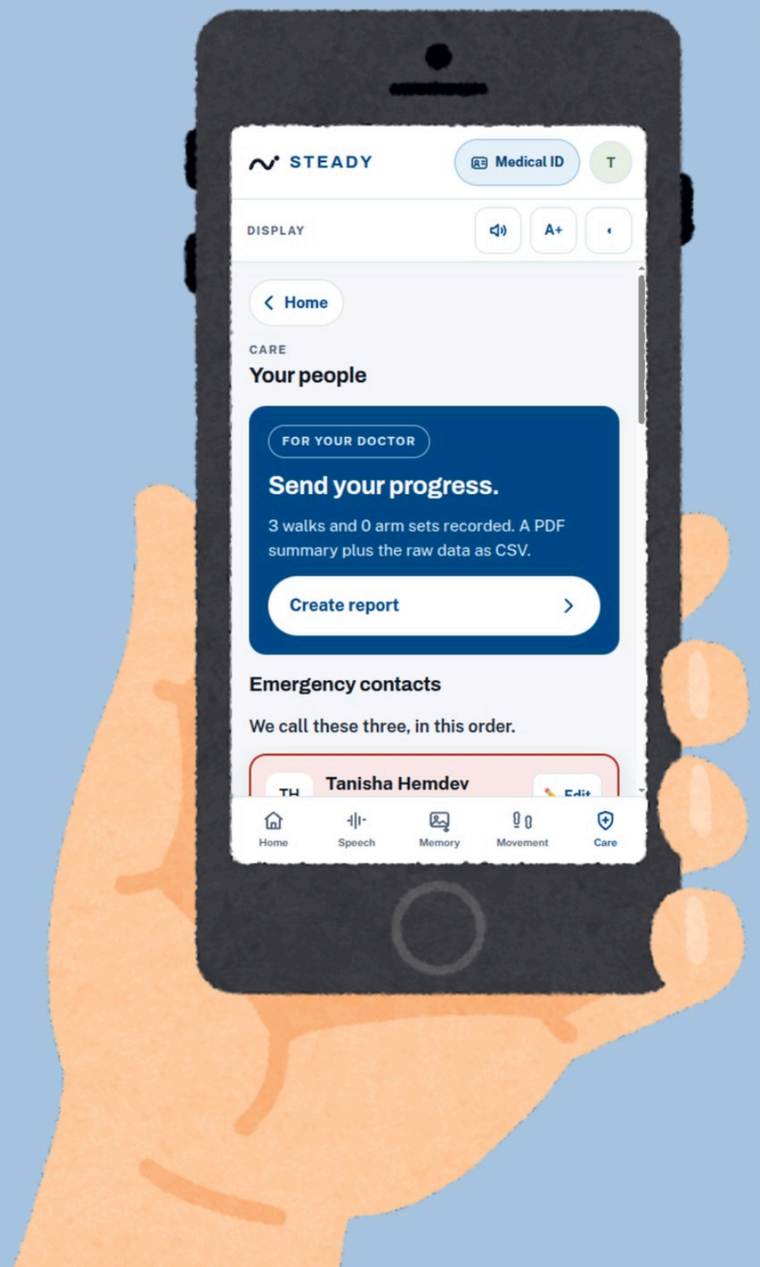

4.CARE HUB:

One record for the whole team. Her physio, speech therapist and neurologist see the same week, and one tap sends a PDF summary plus the raw data as CSV to any doctor.

PDF + CSV report

Shared care record
